January 22 - 29; N=500

How to Read Crosstabs

Q1. All in all, do you think things are headed in the right direction or are things pretty much on the wrong track?

		Gender		
		Man	Woman	Subgroup results
Total results	Total	1371 100%	722 100%	
Responses	Right direction	943 69%	549B 71%	Significance test
	Wrong track	236 17%	100 14%	
	Don't know	192 14%	79 13%	
				Indicates level of significance

(sig=.05) (all_pairs) columns tested BC

How to Read Crosstabs

In the example chart (left), rows represent the three possible response options to the question “All in all, do you think things are headed in the right direction, or are things pretty much on the wrong track?” The three response options are: “right direction,” “wrong track,” and “don’t know.” The amounts in each response category sum to the amount in the “total” row at the top of the table.

The first column, or banner, is the “Total” column. It reflects the overall results. The next two columns reflect the results of a subgroup, “Gender.” The gender subgroup is composed of Males and Females, each with their own column. Both gender groups are assigned a letter (Man=B, Woman=C). These two columns show how males’ attitudes compare to females’ attitudes. As shown in the chart, 69% of the full sample thinks things are headed in the right direction. Looking at the gender subgroup, 71% of women think things are headed in the right direction, compared to 66% of men.

Statistically Significant Differences

If a pair of cells has a difference which is statistically significant, the larger of the two cells is flagged with the letter of the opposite column. The test shows the difference in females’ attitudes about things being headed in the right direction is statistically significantly different than those of males’, which is signified by a “B” (the letter given to Males) next to females’ results for “right direction.” The footnote indicates the level of significance (sig=.05). This level of significance means that 5% of the time, the difference between how the two groups feel about the direction is due to random chance, while 95% of the time the difference is meaningful.

Statement of Limitations

Any sampling of opinions or attitudes is subject to a margin of error, which represents the difference between a sample of a given population and the total population. The margin of error is a statistic expressing the amount of random sampling error in a survey's results and differs by sample size, as reflected in the table below.

Margin of Error Based on Sample Size

N=1200	N=1000	N=800	N=600	N=500	N=400	N=300	N=200	N=150	N=100	N=50
+/- 2.8%	+/- 3.1%	+/- 3.5%	+/- 4.0%	+/- 4.4%	+/- 4.9%	+/- 5.7%	+/- 6.9%	+/- 8.0%	+/- 9.8%	+/- 13.8%

Q1A. How do you describe your gender?

Small modular nuclear power reactors, or SMRs, are designed with modular technology using standardized factory fabrication, making them easier to design, build, and operate than traditional large-scale nuclear power plants. SMRs are typically about one-tenth the size of traditional large-scale nuclear power reactors. SMRs can generate up to 300 megawatts of electricity, equivalent to the power used by 150,000 homes for one year.

Q70. Knowing this, do you support or oppose using small modular nuclear reactors in Oregon?

Consider the following two perspectives about small modular nuclear reactors (SMRs).

- * Supporters of SMRs say that they can be an important source of electricity in Oregon because they provide a clean source of electricity and do not produce any greenhouse gas emissions; they can be built near where electricity is most needed without having to expand costly transmission lines, and they have a proven track record for safety.
- * Opponents of SMRs say that nuclear power produces toxic radioactive material that cannot be safely stored; nuclear power carries unacceptable risks of meltdowns and explosions, and there are better sources of clean energy such as wind and solar.

Q71. After considering these two perspectives, do you support or oppose the use of small modular nuclear power in Oregon?

(sig=.05) (all_pairs) columns tested BCD, EFG, HIJK, LM, NOP, QRS, TUV

Consider the following two perspectives about small modular nuclear reactors (SMRs).

- * Supporters of SMRs say that they can be an important source of electricity in Oregon because they provide a clean source of electricity and do not produce any greenhouse gas emissions; they can be built near where electricity is most needed without having to expand costly transmission lines, and they have a proven track record for safety.
- * Opponents of SMRs say that nuclear power produces toxic radioactive material that cannot be safely stored; nuclear power carries unacceptable risks of meltdowns and explosions, and there are better sources of clean energy such as wind and solar.

Q71. After considering these two perspectives, do you support or oppose the use of small modular nuclear power in Oregon?

Oregon law does not allow nuclear power. Unless this changes, Oregon will have to meet the growing demand for electricity from other sources.

Q74. Knowing this, which do you think is the best source of electricity for Oregon?
