DHM Oregon Panel

June 27 - July 3; N=502

How to Read Crosstabs

Q1. All in all, do you think things are headed in the right direction or are things pretty much on the wrong track?

		Gender		Subgroup results
Total results		Man	Woman	
Total	1371 100%	1371 100%	722 100%	
		(B)	(C)	
Right direction	943 69%	394 66%	549B 71%	Significance test
Wrong track	236 17%	126C 21%	100 14%	
Don't know	192 14%	79 13%	113 15%	
				Indicates level of significance
				(sig=.05) (all_pairs) columns tested BC

How to Read Crosstabs

In the example chart (left), rows represent the three possible response options to the question "All in all, do you think things are headed in the right direction, or are things pretty much on the wrong track?" The three response options are: "right direction," "wrong track," and "don't know." The amounts in each response category sum to the amount in the "total" row at the top of the table.

The first column, or banner, is the "Total" column. It reflects the overall results. The next two columns reflect the results of a subgroup, "Gender." The gender subgroup is composed of Males and Females, each with their own column. Both gender groups are assigned a letter (Man=B, Woman=C). These two columns show how males' attitudes compare to females' attitudes. As shown in the chart, 69% of the full sample thinks things are headed in the right direction. Looking at the gender subgroup, 71% of women think things are headed in the right direction, compared to 66% of men.

Statistically Significant Differences

If a pair of cells has a difference which is statistically significant, the larger of the two cells is flagged with the letter of the opposite column. The test shows the difference in females' attitudes about things being headed in the right direction is statistically significantly different than those of males', which is signified by a "B" (the letter given to Males) next to females' results for "right direction." The footnote indicates the level of significance (sig=.05). This level of significance means that 5% of the time, the difference between how the two groups feel about the direction is due to random chance, while 95% of the time the difference is meaningful.

Statement of Limitations

Any sampling of opinions or attitudes is subject to a margin of error, which represents the difference between a sample of a given population and the total population. The margin of error is a statistic expressing the amount of random sampling error in a survey's results and differs by sample size, as reflected in the table below.

Margin of Error Based on Sample Size

N=1200	N=1000	N=800	N=600	N=500	N=400	N=300	N=200	N=150	N=100	N=50
+/- 2.8%	+/- 3.1%	+/- 3.5%	+/- 4.0%	+/- 4.4%	+/- 4.9%	+/- 5.7%	+/- 6.9%	+/- 8.0%	+/- 9.8%	+/- 13.8%

Q46. Gas taxes are the largest source of transportation funding in the state. These funds help maintain Oregon's roads, tunnels, and bridges. However, revenue from gas taxes is expected to fall because vehicles are becoming more fuel-efficient or run on electricity. One option being discussed to fund road maintenance in Oregon is a road usage charge (RUC), which would charge drivers based on the number of miles they drive, instead of paying a gas tax based on how many gallons of gas they purchase.

Knowing this, do you support or oppose road usage charges as an alternative way to fund maintenance of the state's roads, tunnels, and bridges?

Q46. Gas taxes are the largest source of transportation funding in the state. These funds help maintain Oregon's roads, tunnels, and bridges. However, revenue from gas taxes is expected to fall because vehicles are becoming more fuel-efficient or run on electricity. One option being discussed to fund road maintenance in Oregon is a road usage charge (RUC), which would charge drivers based on the number of miles they drive, instead of paying a gas tax based on how many gallons of gas they purchase.

Knowing this, do you support or oppose road usage charges as an alternative way to fund maintenance of the state's roads, tunnels, and bridges?
